MASTG-TEST-0231: References to Logging APIs

Overview

This test verifies if an app uses logging APIs like `android.util.Log`, `Log`, `Logger`, `System.out.print`, `System.err.print`, and `java.lang.Throwable#printStackTrace`.

Steps

1. Use either [Static Analysis on Android](#) with a tool such as [semgrep](#) to identify all logging APIs.

Observation

The output should contain a list of locations where logging APIs are used.

Evaluation

The test fails if an app logs sensitive information from any of the listed locations.

Best Practices
