TEST

MASTG-TEST-0274: Dependencies with Known Vulnerabilities in the App's SBOM

Overview

In this test case we are identifying dependencies with known vulnerabilities by relying on a Software Bill of Material (SBOM).

Steps

1. Either ask the development team to share a SBOM in CycloneDX format, or, if you have access to the original source code, create one following [Software Composition Analysis \(SCA\) of Android Dependencies by Creating a SBOM](#).
2. Upload the SBOM to [dependency-track](#).
3. Inspect the [dependency-track](#) project for the use of vulnerable dependencies.

Observation

The output should include a list of dependencies with names and CVE identifiers, if any.

Evaluation

The test case fails if you can find dependencies with known vulnerabilities.
